Department: Paint and Plastics Quality

To whom it may concern,

Taha Malik work as a Quality Engineering Intern in the Paint and Plastics Quality Department at Tesla.

His primary responsibilities were to root cause and drive improvements cross functionally. Taha exceeded excellence in all aspects of his internship, including but not limited to quality of work, efficiency, leadership, and dependability.

He worked to reduce paint defects by creating a Java script for production associates to input data while not impacting cycle time. He developed a program with an easy user interface based on feedback he pursued during trials. Taha presented this data along with physical samples to engineering, maintenance, and production teams to drive improvements. In his program, he also included defects from the fascia assembly process to quantify the shops first past yield.

I'm confident Taha will continue his great work ethic in his next endeavor.
